

Website Traffic Analysis Report

Prepared for Alfido Tech | Data period: 2021-08-19 to 2021-08-25

Executive Summary

Over the analyzed week, the platform logged **226,278 total events** across **3,839 unique landing pages** in **212** countries. Of 142,015 pageviews, 20.09% converted to a track preview and **39.24% converted to a click-through**. Roughly **40.47% of landing pages generate pageviews with no downstream engagement at all** (our bounce-rate proxy — see Methodology). Traffic is heavily concentrated in a small number of top tracks and three lead markets (Saudi Arabia, India, United States), while a long tail of pages convert poorly. Five concrete, data-backed optimizations are recommended in Section 6.

Data & Methodology Note

The supplied file (**traffic.csv**) is smart-link click data for music tracks (event types: pageview, preview, click; dimensions: date, country, city, artist, album, track, ISRC, link ID) — not a conventional web-analytics session log. It contains **no session ID, no event timestamp (only a calendar date), and no referrer/UTM field**. As a result, true sessions, unique users, average session duration, and traffic-source attribution cannot be computed from this file. The metrics below use the closest valid proxies, each labeled explicitly, so every number in this report is traceable to what the data actually supports.

Proxy mapping used in this report: Sessions -> Pageviews | Landing pages -> Track/link pages | Bounce rate -> % of links with pageviews but zero click/preview | Referral source -> Country/city (no referrer field exists) | User journey -> Pageview→Preview→Click funnel. Average session duration is **not available** in the source data (no timestamps).

1. Key Metrics

Metric	Value	Notes
Total events	226,278	7-day period
Pageviews (proxy: sessions)	142,015	Landing-page loads
Clicks	55,732	Streaming click-throughs
Previews	28,531	In-page audio previews played
Unique landing pages	3,839	Distinct link IDs
Countries reached	212	
Click-through rate (CTR)	39.24%	Clicks / Pageviews
Preview rate	20.09%	Previews / Pageviews
Bounce-rate proxy	40.47%	Links with pageviews but zero click/preview

Avg. session duration	Not available	No timestamps in source data
-----------------------	---------------	------------------------------

2. Data Cleaning & Quality Summary

Column	Missing (raw)	Missing %	Treatment
country	11	0.0%	Filled with 'Unknown'
city	11	0.0%	Filled with 'Unknown'
artist	37	0.0%	Filled with 'Unknown'
album	5	0.0%	Filled with 'Unknown'
track	5	0.0%	Filled with 'Unknown'
isrc	7,121	3.1%	Filled with 'Unknown'

Data types: all 9 source columns loaded as text/object; **date** was parsed to a proper datetime type. **Mode values:** event = pageview, country = Saudi Arabia, city = Jeddah, artist = Teshher, track = Jalebi Baby. **Exact duplicate rows:** 103,711 (45.8% of rows) were *retained* rather than dropped — since there is no timestamp or user/session ID, an identical row plausibly represents a separate real event (e.g. two different listeners in the same city on the same day), not a logging duplicate.

3. Visualizations

3.1 Top Landing Pages by Pageviews

Bar chart of the 10 highest-traffic landing pages (tracks) by pageview count.

3.2 Daily Event Trend

Line chart of pageviews, previews and clicks across the 7-day window.

3.3 Event Type Distribution

Event Type Distribution

Pie chart showing the overall mix of pageview, click and preview events.

3.4 Traffic by Country (Referral-Source Proxy)

No referrer/UTM field exists in the data; country/city is the closest available source-like dimension.

3.5 User Journey Funnel

Aggregate volume through Pageview -> Preview -> Click. Not a per-user path (no user ID in data), but the best available journey view.

4. Top Entry (Landing) Pages

Artist	Track	Pageviews	CTR %
Tesher	Jalebi Baby	25,175	38.5%
Anne-Marie	Beautiful	6,600	32.0%
Tundra Beats	Beautiful Day	5,981	36.7%
Surf Mesa, Emilee	ily (i love you baby) (feat. Emi	4,303	33.2%
Reyanna Maria	So Pretty	3,532	33.6%
50 Cent, Olivia	Candy Shop	3,407	32.6%
DMNDS, Strange Fruits Music,	Calabria (feat. Lujavo & Nito-On	3,354	44.7%
Shawn Mendes, Tainy	Summer of Love (Shawn Mendes & T	3,299	41.0%
Roddy Ricch	Late At Night	3,039	44.9%
Bella Poarch	Build a Bitch	2,440	33.9%

5. Top Exit / Drop-off Pages

Pages with meaningful traffic (≥ 50 pageviews) but the lowest click-through rate.

Artist	Track	Pageviews	CTR %
Wun Two	eonto	148	18.9%
Adrian Jonathan, Cody Martin	Worship Instrumental - Instrumen	88	19.3%
JK Jones	Astronaut In The Ocean	77	19.5%
Kreepa	Oh No	84	20.2%
Ajam Soul	New Way	62	21.0%
Neha Kakkar	Tera Ghata	189	21.2%
Leto, Ninho	Vie de star feat Ninho	112	21.4%
DLJ, BIDØ	To the Moon	563	21.8%
MC Ryan SP, Mc Don Juan, MC	Revoada do Tubarão 2 (feat. Mc D	72	22.2%
Paramore	Hard Times	90	23.3%

6. Recommended Optimizations for Alfido Tech

1. Fix high-traffic, low-conversion pages first

Prioritize the pages in Section 5 (≥ 50 pageviews, lowest CTR). Audit thumbnail artwork, the preview clip, and CTA button placement/copy on these specific pages before making platform-wide changes — this is where the largest, fastest conversion lift is available.

2. Reduce reliance on a single hit track

The top track alone drives roughly 18% of all pageviews. Diversify promotional spend and homepage placement across the next 10-15 tracks so a decline in one campaign doesn't sink total traffic.

3. Convert preview behavior into clicks

About 1 in 5 pageviews trigger a preview, but many of those visitors never click through. Test placing the primary streaming CTA directly beside or above the preview player, and trigger a CTA prompt automatically when preview playback ends.

4. Double down on top markets, localize the next tier

Saudi Arabia, India and the United States lead volume — ensure store links, language and currency are fully optimized there. A/B test localized landing copy in the next tier of markets (Iraq, UK, Pakistan, UAE, Turkey) to convert existing traffic more effectively.

5. Instrument the funnel properly going forward

Add a session ID, event-level timestamp, and referrer/UTM field to the tracking pipeline. This single change unlocks true session counts, real session duration, accurate bounce rate, and genuine traffic-source attribution (organic/paid/social/direct) — all of which are currently impossible to measure from this dataset.

Deliverables accompanying this report: **traffic_analysis.ipynb** (full notebook with interactive Plotly visualizations and all code) and this PDF. Source cleaned data: **traffic_clean.csv**.
